Theory of intensities and polarization in Raman spectra of halogen-substituted methanes. M. V. Volkenstein and M. A. Eliashevitch (Compt. rend. Acad. Sci. U.R.S.S., 1944, **48**, 51-59).—The theory previously developed (A., 1943, I, 116) is applied to CCl_4 , CHCl_3 , CH_2Cl_2 , MeCl , MeBr , CH_2Br_2 , CHBr_3 , and CH_2Br_2 . The original theory depends on the additivity of effects due to valency bonds, but this approximation is not always valid. The polarisability of a bond is not only a function of its length, but it also varies with the length of neighbouring bonds and with valency angle. However, the theory gives satisfactory agreement between observed and calc. vals. of intensity and polarisation, the agreement being better in the case of intensity. The calc. degree of depolarisation of deformational vibrations is > observed vals. The polarisability (α) of the C-H bond is small, but the variation of α with bond-length (r) is considerable. $d\alpha/dr$ is the smaller the more ionic is the nature of the bond.

PRINCIPLES AND PROPERTIES INDEX

The theory of vibration spectra of polyatomic molecules.
IV. Spectra of deuteriomethane and electrooptical
properties of valence vibrations. M. V. Voikenshtein
(State Optical Inst., Moscow). *Acta Physicochim.*
U.R.S.S. 20, 833-50 (1945).—The formulas derived in
previous papers (*C.A.* 40, 273) are here used to calc. the
vibration frequencies, their intensities, and the depolariza-
tion factors in the Raman spectra of CH₄, CH₃D, CH₂D₂,
CHD₃, and CD₄. The calc'd. values are in agreement with
observed values wherever these are available from observa-
tions of Raman and infrared spectra. For the effective
charge of the C—H bond a value that is approx. 0.07e is
derived.

Polarizability and the Franck-Condon principle. M.
V. Vol'kenshteyn and M. A. El'yashevich (Leningrad
(Univ.) "Izvest. Akad. Nauk S.S.R., Ser. Fiz." 12,
548-52 (1948). —Theoretical. The polarization formula of
Placzek (*Rayleigh Scattering and Raman Effect*, 1935,
par. 14) is derived; the intensity of the Raman scattering
would be zero if the Franck-Condon principle were a
strict and not a probability law. S. Pakswert.

Polarization of spectral lines of Raman scattering. II
V. S. Belsovich and M. V. Vol'kenstein. *Izv. Akad.*

Nauk SSSR, Ser. Fiz., 12, 533 (1948). An exptl. set up is described consisting of a spectrograph with a doubly refractive polarizer in front of the slit. Since the polarizing prism separates both components of the scattered radiation but turns them through 45°, the illuminator (Hg lamp) was mounted at a 46° angle with respect to the axis of the vessel contg. the liquid. This method permits exposures of 3-12 hours. The depolarization of Raman lines of CCl_4 , CaI_4 , and PhMe was measured and compared to data available in literature. Data on naphthalene in CCl_4 and benzene soln. are in disagreement with data taken by Nedungadi. The depolarization of solns. in benzene, pyridine, or CCl_4 of the following nitro compounds has been measured: Nitromethane, nitrobenzene, nitrotoluene, *p*-nitrochlorobenzene; *o*-, *m*-, *p*-nitrophenol, *p*-nitrosaniline; *m*-dinitrobenzene; toluene, nitronaphthalene, and dinitronaphthalene. It is shown that groups in para position increase the axial component in the mol.

Electronic spectra and intensities in Raman spectra
M. V. Vol'kenshtain, *Zhur. Eksppt. Teor. Fiz.* 18, 71
81 (1947). - Pleszczek's criterion of intensity and polarization of Raman lines, the deriv. of the mol. electronic polarizability with respect to the normal coordinate, can be represented as function of the polarizabilities α of the individual valence bonds and the derivs. $\partial\alpha/\partial q$ with respect to the bond coordinate q . On the basis of the Kramers-Heisenberg formula, $\partial\alpha/\partial q$ can be linked with the properties of the ground and excited electronic states of the mol. In the case of diat. mols., the theory accounts for the low intensity of Raman lines of ionic bonds and their increase with decreasing polarity, e.g. in the series C—Cl, C—Br, C—I. The criterion of bond polarity derived from Raman spectra coincides with the spectroscopic criterion of Franck. The theory also accounts for the high Raman-line intensities of conjugate-bond and aromatic org. mols., i.e. mols. characterized by nonadditivity of bond energies.
N. Thom

cA

Polarization of Raman lines. M. V. Volkenshteyn, *Zhur. Eksppt. Fiz.*, 18, 139-148 (1948). The following rules, derived on the basis of the valence optical scheme, and supplementing Pleszak's rules, claim only approx. validity but are nonetheless practically valuable and borne out by comparison with ample exptl. data:
① For any fully symmetrical pure deformation vibration of a mol. of any symmetry group, the degree of depolarization $\rho = 0\%$.
② For a vibration of a diatomic mol. or a characteristic vibration of an individual bond, ρ is comprised between $\frac{1}{2}$ and 0.
③ For fully symmetrical vibrations of any plane mols. of the symmetry D_{N_1} built up of identical bonds, ρ is equal and independent of the no. of bonds.
④ As a generalization of rule 2, for any fully symmetrical pure valence vibration of a bond or a group of identical bonds, the upper limit of ρ is $\frac{1}{N}$. Then

The chain is characterized by the degree of convolution, or the thermodynamic flexibility, and the kinetic flexibility. The degree of convolution is the ratio of the max. length of the chain to the length of the convoluted chain. A method is given for the calcn. of this ratio and it is applied to a series of polymers. A study of the properties of these mols. shows the relation between the flexibility of the mols. and their chem. structure.

Conclude that for small extensions (disregarding terms of the order x^3) the "energetic" elastic force f_1 and the "entropic" elastic force f_2 connected with the transition of convoluted isomers into trans-isomers compensate each other; consequently, for small extensions this transition does not change the free

275T95

energy of the chain and the recovering force bears a purely entropic character. For large extensions the above-indicated compensation will not hold. Propose that a one-dimensional model in the main correctly gives the dependence of stretching of polymer chains upon their flexibility and external force. Presented by Acad A. F. Ioffe 22 Jun 53.

VOL'kenshteyn, M.V.

Internal rotation in polymer chains and the physical properties thereof. II. The elongation of polymer chains. M. V. Vol'kenshteyn and O. B. Ptitsyn. *Zhur. Tekh. Fiz.* 25, 649-61 (1955); cf. *C.A.* 49, 21622. — Math. The av. and averages of the squares of the distances between and among the chain ends of polymer chains are calc'd, when they are under the action of an external force f , and these averages in their most general expression are presented as a series of $f l/kT$, where l is the length of one link of the chain. The equations are solved for one-dimensional and two-dimensional models on the basis of the theory of rotation isometry, and the various mechanisms of chain elongation are discussed. The findings on these models can be applied freely to linked chains with long statistical elements; this is detaile, from the congruence of the max. length and av. square of the length of such model with the corresponding dimension of the true chain. The diffusion analogy cannot be applied to such a chain, which is under the influence of an external force. III. The change of the internal energy of polymer chains upon elongation. *Ibid.* 662-70. — Math. On elongation of the polymer chain with impeded internal rotation, there is generated in such chain not only an entropy, but also an energy force. At small elongations this force is compensated by an addit. entropy energy that is not taken into account in the ordinary theory. The elongation of the polymer in a block is discussed, and thus an expression for the modulus of elasticity of rubber is obtained that is based upon the grid theory. The energy effects that occur on elongation of the polymer in a block are discussed also; the sp. heat of the polymer chain changes upon elongation.

Author : Bazhenov, N.M., Vol'kensteyn, M.V., Volotina, T.A.
Title : Optical Activity and Vitrification.

Orig Pub : Zh. tekhn. fiziki, 1955, 25, No 11, 1861-1863

Abstract : Investigation of the temperature variation of the rotation of the plane of polarization in rosin. The curve $\phi(T)$ displays a break at the rosin vitrification temperature $T = 240^\circ$. The break at the same temperature is observed on the curves $n(T)$ and $\rho(T)$ (n is the index of refraction and ρ the density), since $\phi = K \frac{n^2-1}{n^2+2}$ where K is a constant, and g is the molecular rotation constant (gyration). Using the Lorentz-Lorenz equation the authors derive an expression

$$\frac{d\phi}{dT} = \left[1 + \frac{(n^2-1)(n^2-2)}{6n^2} \right] \frac{1}{\rho} \frac{dp}{dT} + \frac{1}{g} \frac{dg}{dT}.$$

Estimating the individual terms of this equation from obtained experimental data, the authors obtain $\frac{(n^2-1)(n^2-2)}{6n^2} \sim 0.04$ and show that the temperature variation $\phi(T)$ and the break in the derivative $d\phi/dT$ at

Abs Jour : Ref Zhur . Fizika, No 2, 1957, No 4990

T_g are determined not only by the change in $d\phi/dT$ but also by the direct change in g , i.e., in dg/dT . The quantity $(1/g) (dg/dT)$ changes in the case of ϕ approximately three times more rapidly than the quantity $(1/\rho) (d\rho/dT)$. The authors indicate that an investigation of the temperature behavior of the optical activity gives a new sensitive method for studying the vitrification, making it possible to investigate separately the effects connected with the changes in the molecule packing (variation of $d\phi/dt$) and with the changes in the intermolecular interaction (variation of dg/dT).

Title : Investigation of the Stretching of Polymers in Polarized Infrared Light

Orig Pub : Zh. tekhn. fiziki, 1955, 25, No 14, 2486-2491

Abstract : The authors derived an equation for the ratio of the coefficient of absorption of two bands at various degrees of tension (K''_1/K''_2): (K''_1/K''_2) , where the indices 1 and 2 pertain to bands ν_1 and ν_2 and the indices ' and '' pertain to the first and second stretchings. This ratio is unity if the content of the rotation isomers does not change with stretching. The stretching of polyethylene and polyvinyl acetate was investigated. It is shown that at elongations of 1,000% and more, the content of the rotation isomers changes. The stopping of the growth of dichroism at 100% elongation indicates the absence of further orientation.

Introduction by M. V. Vol'kenshteyn and O. B. Ptitsyn, Problemy Sovremennoy Fiziki, Vol 8, No 12, Dec 56, pp 3-5

This issue of the periodical Problemy Sovremennoy Fiziki, which publishes translated articles illustrating progress in various fields of physics outside the USSR, represents a collection of non-USSR articles on the physics of polymers. The translations contained in this issue have been edited by M. V. Vol'kenshteyn. Vol'kenshteyn and Ptitsyn comment as follows on five articles published as a separate section (pp 173-222) under the heading "The Action of Nuclear Radiation on Polymers":

"The last, sixth section of the collection of articles consists of papers that deal with the action of nuclear radiation on polymers. This field is of great interest from both the physical and the chemical standpoint, because the processes which take place in polymers under the action of radiation (cross-linking, etc.) lead to the formation of substances which have new and valuable properties. Investigation of the processes and characteristics involved is also of importance for nuclear technology, in which some high-polymer materials are applied."

Title : Photoelastic Effect in Polystyrol and Its Halogen Derivatives.

Orig Pub: Zh. tekhn. fiziki, 1956, 26, No 8, 1730-1737

Abstract: The photoelastic effect (PE) was measured in polystyrol (I) (130000), polyparachlorostyrol (II) poly- 2.5 dichlorostyrol (III) (60000), polyorthochlorostyrol (IV) (80200), poly-3.4 dichlorostyrol (V) (30000), polyorthoiodostyrol (VI) (20000) and polyparaicodostyrol (VII) (32000). The numbers in the parentheses represent the molecular weights. The PE was studied in tension of thin films by constant load and at temperatures above the vitrification temperature. With the aid of a setup with a polarization microscope, simultaneous measurements were made of the elongation $\Delta l/l$, the birefringence, Δn , and the true load σ . The PE in vitrified films was measured in a photoelectric

Card : 1/3

USSR / Optics

K

Abs Jour: Referat Zhur-Fizika, 1957, No 4, 10353

setup. The time dependences of $\Delta l/\ell$, Δn , and the photoelastic coefficient $\mathcal{E} = \Delta n/\ell$ were obtained. The tension curves have a characteristic S-shape form with a relative saturation, this being due to the presence of a labile lattice in the block linear polymer. The step-like character of the tension of I discloses the damage to the lattice structure and formation of new labile nodes. \mathcal{E} rapidly reaches its maximum value and diminishes only slightly upon further tension. \mathcal{E}_{\max} is practically independent of σ_{init} over a wide range of σ_{init} (for II: 2 -- 18×10^6 dyne/cm²). The average values of \mathcal{E}_{\max} were used to find the effective anisotropic polarizabilities of the chain $\Delta \alpha$ (Treloire, L. Physics of Elasticity of Rubber, IL, 1953): I -- 140, II -- 210, III -- 170, IV -- 130, V -- 340×10^{-25} cm³. In accordance with the theory (Gotlib Yu. Ya., Volkenshteyn, M.V., Byutnor, E.K., Dokl AN SSSR, 1954, 99, No 6, 935), the known value of η (the average cosine of the angle of internal rotation about the bond C-C in I) and the value of $\Delta \alpha$ were used to determine $\mu = \cos^2 \psi'$ (ψ' is the angle of

Card : 2/3

USSR / Optics

K

Abs Jour: Referat Zhur-Fizika, 1957, No 4, 10353

rotation of the phenyl ring), after which these values of α and γ were used to calculate $\Delta\alpha$ for II -- VII. Satisfactory agreement with experiment was obtained for II and V, which indicates a similarity in the conditions of internal rotation in I, II, and V. For II and IV, which contain chlorine in the ortho position, the calculated values of $\Delta\alpha$ are greater than those observed, this being due to the greater resistance to rotation of the suspended weight.

CARD 1 / 2

PA - 1561

SUBJECT USSR / PHYSICS
AUTHOR WOL'KENSTEJN, M.V., PTICYN, O.B.
TITLE The Relaxation Theory of the Formation of Glass.
PERIODICAL I. Solution of the Basic Equation and its Examination.
Zurn. techn. fis., 26, fasc. 10, 2204-2222 (1956)
Issued: 11 / 1956

Proceeding from the most general molecular-kinetic ideas the basic laws of glass formation and of softening are here derived. The theory found must then be suited for all objects from which glass is formed. Relaxation processes are here dealt with by an equation which describes the transition of kinetic units from one energy state to another. The spectrum of relaxation times is on this occasion neglected. Reaction may be of the first or second order ("isomerization" or "dimerization" respectively). The influence exercised by reactions of a higher order may be neglected. In the case of a reaction of the first order the elementary acts of transition from the nonexcited state (state 1) to the excited state (state 2) take place with the participation of only one kinetic unit. The reaction of the second order consists in the production and dissociation of the bindings among the kinetic units. On the occasion of the investigation of such relaxation processes which are connected with only little deviations from equilibrium the equation of the first order may always be used. Here only reactions of the first order are investigated. Reactions of the second order are studied later.
At first an expression for the solution of the basic equation is given. On this

Zurn. techn. fis., 26, fasc. 10, 2204-2222 (1956) CARD 2 / 2

PA - 1561

occasion the dependence of the transition probability on the structure of the liquid is neglected. At first the most simple process is investigated in which the exterior parameters of the system do not depend on time. Next, the case is investigated in which the temperature of the system changes with constant or variable velocity. The solutions found for the share V of the kinetic units which are in an excited state are written down. There follows the mathematical discussion of the solution obtained.

Forming of glass and softening: Every system satisfying the above conditions is suited for the formation of glass in connection with cooling and for softening during heating. Furthermore, equations are obtained which connect the temperature of glass formation T_g' and of the softening T_g with the parameters of the system and with the modification velocity $|q|$. With increasing $|q|$ also T_g' and T_g increase. Next, the solutions of the basic equation for the vitrification interval and for the domains above and below the vitrification interval are discussed. Among others, V does not depend on temperature within the range below the vitrification interval, i.e. the structure of the liquid is frozen.

 Molekulyarnaya spektroskopiya (Papers of the 10th All-Union
 Conference on Spectroscopy. Vol. 1: Molecular Spectroscopy)
 [Lvov] Izd-vo Lvovskogo univ-ta, 1957. 499 p. 4,000 copies
 printed. (Series: Its: Pizichnyy zbirnyk, vyp. 5/8/)

Additional Sponsoring Agency: Akademiya nauk SSSR. Knissiya po
 spektroskopii. Ed.: Jazer, S.L.; Tech. Ed.: Saranyuk, T.V.;
 Editorial Board: Landberg, G.S., Academician (Resp. Ed., Deceased),
 Neporent, B.S., Doctor of Physical and Mathematical Sciences,
 Pabelinskiy, I.L., Doctor of Physical and Mathematical Sciences,
 Pahrikant, V.A., Doctor of Physical and Mathematical Sciences,
 Kornitskiy, V.G., Candidate of Technical Sciences, Rayskiy, S.M.,
 Candidate of Physical and Mathematical Sciences, Klimovskiy, L.K.,
 Candidate of Physical and Mathematical Sciences, Miliyanchuk, V.S.,
 A. Ye., Candidate of Physical and Mathematical Sciences, and Glauberman,

Card 1/30

Mikitin, V.N., B.Z. Volchek, and M.V. Vol'kensteyn.
 Using Infrared Polarized Light in Determining
 the Orientation of Polymers

- Vol'kensteyn, M.V., and O.B. Ptitsyn. Behavior of Hydrogen Bonds During Vitrification	411
Lazarev, A.N. Vibrational Spectra of Orthosilicic Acid Esters and Their Relation to Silicate Spectra	437
Lotkova, Z.N., V.V. Obukhov-Denisov, N.N. Sobolev, and V.F. Cherenishov. Raman Spectrum of Vitreous Boric Anhydride	440
Sidorov, T.A., and N.N. Sobolev. Infrared Spectra and the Structure of Phosphorous, Phosphoric and Boric Anhydrides	445
Bobovich, Ya. S., and T.P. Tulub. Raman Spectra of Double-complex Silicate Glasses	448
Sevchenko, N.A., and V.A. Florinskaya. Reflection and Transmission Spectra of Various Modifications of Silica in the Wave Length Range From 7 to 24 Microns	455

VOLKENSHTEIN, M. V., FRIGEN, G. D.

"Relaxation theory of polymers," a paper presented at the 9th Congress on the Chemistry and Physics of High Polymers, 20 Jan-2 Feb 57, Moscow, Polymer Research Inst.

B-3,094,395

3

VOLKSHINER, N. V., NIKIFOROV, V. N., and MITRAK, B. S.

"Stretched films of polymers in polarized infrared light," Highpolymer Research Inst., Acad. Sci., a paper presented at the 9th Congress on the Chemistry and Physics of High Polymers, 26 Jan-2 Feb 57, Moscow.

B-3,084,395

VOLKENSITEVU, M. V., SOGANOVYANTS, S. S.

"Synthesis and properties of some stereoisomeric polyamides and polyethers,"
a paper presented at the 9th Congress on the Chemistry and Physics of High Polymers,
28 Jan-2 Feb 57, Moscow, Polymer Research Inst.

B-3,004,395

VOLKENSTEIN, M. V., BAYZHENOV, N. N., GOFLIB, Y. Y., ROSENTHAL, L. D., BYKOV, M. V.

"The photoelastic effect and the free rotation of linear polyamides," a paper presented at the 9th Congress on The Chemistry and Physics of High Polymers, 28 Jan-2 Feb 57, Moscow, Karpov, Inst.

B-3,084,395.

VOLKENSHTEIN, M. V., KOTON, N. M., and ANUFRIYEV, V. V.

"Inhibition of styrene polymerization by anthracene," a paper presented at the 9th Congress on the Chemistry and Physics of High Polymers, 28 Jan-2 Feb 57, Moscow, Research Inst. Organic Chemistry.

B-3,084,395

"APPROVED FOR RELEASE: 08/09/2001

CIA-RDP86-00513R001860510018-1

VOLKENSTEYN, M. V., and PITTSYN, O. V., Institute of Macromolecular Compounds
AS USSR, Leningrad

"Theory of Elongation of Polymer Chains and Networks," a paper
submitted at the International Symposium on Macromolecular Chemistry,
9-15 Sep 1957, Prague.

APPROVED FOR RELEASE: 08/09/2001
